BOSTON:
PRINTED BY GEORGE C. RAND & AVERY,
No. 3 CORNHILL.

CHARLES GOODYEAR.

Entered according to Act of Congress, in the year 1856,
By GEO. N. DAVIS, & BRO.,
In the Clerk's Office of the District Court of the District of Massachusetts.

INDIA RUBBER.

The most astonishing and useful discovery of the nineteenth century, after the practical application of Steam and Electricity, is the employment of India Rubber for manufacturing purposes.

Previous to entering into a description of the articles manufactured, it is proper that we should give some account of the substance itself and the history of its development.

The first knowledge of it is due to La Condamine, a French philosopher, who in 1730 was sent by his Government to Peru to measure an arc of the meridian.

The tree which produces rubber, or *caoutchouc*, (as it is called by the natives of South America), is found in the tropics of both hemispheres. It rises to the height of fifty or sixty feet, without branches, and is crowned or tufted with rich foliage. The leaves are a deep green, thick and glossy, six or seven inches in length; the bark is smooth, and the fruit consists of white almonds, of an agreeable flavor, much liked by the natives.

In order to obtain this substance the natives of the valley of the Amazon make a longitudinal gash in the bark of the tree with a narrow hatchet; a thick, white and oily liquid (a sort of vegetable milk) flows out, a wedge of wood is inserted to keep the gash open, and a small clay cup is stuck to the tree beneath the gash. In four or five hours the milk ceases to run, and each wound has yielded from three to five table-spoonfuls. The "Seringero," or rubber gatherer, then empties the contents of the cups into an earthen vessel and commences the operation of forming it into shapes and smoking it. This must be done at once as the milk soon coagulates. A fire is made on the ground, of nuts of the wassou palm tree, over which is placed, inverted, an earthen pot with a hole in the bottom whence issues a jet of pungent smoke. Moulds are made either of clay or wood, which are dipped into the milk, and then passed slowly through the hot smoke. When the required

thickness is obtained the moulds are cut or washed out. Smoking changes the color of the rubber very little, but by exposure to the sun and atmosphere it becomes brown, and in time black. The superiority of the rubber imported from the valley of the Amazon is said to be owing to the peculiar properties of the smoke of this nut, no other smoke producing a similar effect upon the gum.

A belt of forest trees extends ten degrees each side of the equator, which yield India Rubber of various kinds; so the supply is literally inexhaustible. The gum from India and the Pacific coast of South America is obtained by allowing the sap to flow down the side of the tree, and is then gathered with the loose bark and dirt into *ceroons* or bundles, for shipment.

For a long time this substance was valued simply as an object of curiosity, to be preserved in collections of Natural History, and its first practical application was as an eraser of pencil marks.

About the year 1821, Chas. Macintosh of England, having learned how to dissolve the gum in spirits of turpentine, commenced manufacturing the goods which now bear his name, by spreading the gum so dissolved between two layers of cloth. The rude overshoes made by the natives in South America from the natural gum, were beginning to be worn, and in 1823 five hundred pairs of shoes were imported into Boston. At a later date gum-elastic became the subject of scientific investigation and many persons commenced experimenting with it. In 1832, the considerable manufacture of it was commenced in Massachusetts, by John Haskins and Edwin M. Chaffee, who in connection with others started the celebrated Roxbury India Rubber Company, which was shortly after incorporated with a capital of \$400,000. For this company Mr. Chaffee invented the famous mammoth machine for spreading rubber without a solvent—the machine itself costing nearly \$30,000. Similar machines are now required by all manufacturers of rubber goods. The apparent prosperity of this company induced the starting of factories in Boston, Chelsea, Woburn and Framingham, Mass., New York City, Staten Island and Troy, N. Y. with capitals of from \$50,000 to \$500,000. These companies made their goods by dissolving the rubber in camphene or other solvents, then mixing lamp black with it, and while in the form of paste spreading it on cloth from which coats, &c., were made. The goods were then dried in the sun or in a warm room until the solvent evaporated, leaving a coating of rubber. This, however, did not prevent heat and cold from affecting the rubber; the goods in summer would

frequently stick together before they left the factory, and in winter they became stiff and cracked. The rubber also decomposed in a short time, entirely destroying the goods. After striving from one to three years to surmount the difficulties of the manufacture, the business was generally abandoned with a total loss of the capital invested.

In 1834, Charles Goodyear of New Haven, Conn., had his attention drawn to the manufacture of rubber, and, ignorant of the unparalleled difficulties attending it, (the more peculiar as the goods must be tested by hot and cold weather before one could know that they would not decompose) commenced experimenting, resolved to accomplish that which had baffled scientific men, and divest the substance of its adhesiveness and objectionable qualities.

It would be impossible here to detail the hopes and fears — the *almost* success, then signal failure — the innumerable experiments made so sanguinely, followed by disheartening trials, the struggles, toil, poverty and discouragements experienced during the next six years. They were such as are incident to all valuable discoveries. But blessed with indomitable perseverance and confident of *ultimate* success, despite his own losses, the remonstrances of friends and the distrust of the public, he continued his efforts with unabated ardor and diligence.

Meanwhile his knowledge of the capabilities of the substance greatly increased, and many new and useful properties were imparted to it. In 1834, he obtained the first *white* compound. In 1835, the first sheets of gum were manufactured. Soon after he discovered the *nitric acid gas* process, but that did not change the character of the gum *throughout*. In 1836, India Rubber was applied to the art of printing, and newspapers, maps, &c., were printed on gum-elastic drapery. In 1838, the *solarizing* process (which consists in exposing rubber, when combined with sulphur, to the sun's rays,) was invented through the agency of Nathaniel Hayward, of Woburn, Mass., who first used sulphur as a *drier* of rubber, and for which combination he obtained a patent, Feb. 24, 1839. The manufacture of shoes was attended with some success at this time, and piano-forte covers, table and carriage cloths, mail bags, life preservers, &c., were also made.

Still the true cause of the decomposition of the goods and its remedy, were undiscovered, and misfortune and disappointment pursued him unrelentingly. His family were reduced to extreme poverty, he was imprisoned for debt, denounced by his friends as ob-

stinate and infatuated, and deprived of all sympathy and encouragement. Had the desired improvement required the aid of machinery, or any amount of capital beyond a few sixpences at a time, *necessity* would have compelled him to discontinue his experiments. But his extraordinary perseverance was at last rewarded, and, as the result of his unremitting application and constant observation, and as a suitable climax to his long series of inventions, the *Vulcanizing* process was discovered.

It was a well established fact that rubber melted at a heat of 200 degrees Fahrenheit, and in the sun's rays at 100 degrees ; but in experimenting he accidentally placed some specimens in contact with a hot stove, and was surprised to see that instead of melting they charred like leather. He immediately inferred that if the charring could be arrested at the right point, the gum would lose its adhesiveness *throughout*. He continued his inquiries and experiments some months alone, until convinced that the new substance was proof against cold and the solvents of native gum, and consequently the eagerly-sought and long-desired discovery was made. This occurred in 1839, but Mr. Goodyear's difficulties were by no means ended. It was impossible to restore the confidence of the public after its recent and great losses, and his inability to convince others of the importance of the subject caused intense anxiety lest his theory should be lost to the world. Without money, without credit, without sympathy, in utter destitution, at the mercy of pawn-brokers, he had yet to endure two most trying years before a *single person* was convinced and willing to assist. In 1841, he invented shirred or corrugated goods. In 1843, he so far perfected his invention as to make application for patents, in the United States, England and France, and in 1844 obtained his patent for VULCANIZED RUBBER. Since then, numerous patents have been taken out, both in the United States and foreign countries, for modifications of the vulcanizing process ; but in all, the two essential agents, *sulphur* and a *high degree of heat*, have proved *indispensable*.

The importance of this invention cannot be too highly estimated. New, curious and useful applications of it are constantly made, and it is destined to work a signal revolution in the industrial arts, and to promote greatly our manufacturing and commercial interests.

The change effected in the native gum by this process may be compared to that which is wrought in a perishable skin or hide, by the process of tanning. A substance is produced possessing all the

valuable properties of gum-elastic, in the highest degree of perfection, without the imperfections of the native gum which would ever have prevented its application to many purposes of great utility. It is not simply an improvement, but, in the language of Daniel Webster, "it introduces quite a new material into the manufacture of the arts, that material being nothing less than ELASTIC METAL. It is hard like metal, and as elastic as pure original gum elastic. It is as great and momentous a phenomenon occurring to men in the progress of their knowledge, as it would be for a man to show that iron and gold could remain iron and gold, and yet become elastic as India Rubber."

Mr. Goodyear styles the improved article *metallic gum-elastic*. He still devotes his time, property and inventive genius to the development of this extraordinary substance, and the result of his experiments are astonishing indeed. After long efforts he has discovered the method of giving to rubber the qualities of ivory, buffalo horn, shell and whalebone, which under the name of HARD GUM is considered his greatest invention. It is infinitely superior to Gutta Percha, in its qualities of firmness, beauty and durability. It offers to the tool all the resistance of the hardest wood, of horn, bone and even of marble. It can preserve the pliability of whalebone or take the rigidity of tempered steel — be flexible and as easily wrought as leather, or become brittle as glass.

This material is susceptible of the most beautiful polish, and can be used in either massive pieces or in thin layers of veneering. The extent, variety and beauty of articles manufactured from HARD GUM is almost incredible; yet opposite as its results are, through all its transformations it preserves its durability, tenacity, impermeability, and the property of retaining the shape into which it is moulded and heated.

These inventions are now so far perfected as to form an important and staple branch of industry, in which millions of dollars are invested, both in this country and in Europe, and the business is steadily increasing in extent and value.

Our connection with the different manufactories, and thorough knowledge of the business, together with a stock unequalled in extent and variety, enable us to offer to the trade unusual facilities and the best terms. An examination of our Warehouse will convince purchasers that they are buying at "head quarters." Unlike other establishments in this country, we offer to the public not simply the productions of a single manufactory, but every article pro-

duced from India Rubber and Gutta Percha. English and French manufactures are regularly imported and new inventions and applications are received as soon as perfected.

The following catalogue will give a partial idea of the variety of articles for sale, and their adaptability to the ordinary wants of life.

NATIVES GATHERING RUBBER.

India Rubber Clothing, &c.

THE different qualities of CLOTHING may be classed as VULCANIZED and SOLARIZED.

The VULCANIZED are manufactured exclusively under GOODYEAR'S PATENTS, are warranted to stand any climate, and are not affected by the variations of the atmosphere.

The SOLARIZED, or CAMPHENE FABRICS, are manufactured from Rubber, combined with sulphur, and heated in the sun.

SIZES.—In all cases, No. 1 is the smallest.

FIREMAN'S COATS.

Double-breasted, with a standing collar and strap, close fitting, medium length, full skirt, with pockets; the sleeve buttons tightly at the wrist. Being proof against the action of extreme heat, where woollen fabrics would consume, they are peculiarly adapted for the use of firemen. Companies supplied at special rates, after furnished patterns.

SIZES — 1, 2, 3, 4, 5.

Black, - - - Vulcanized, ^{EACH.} \$5 50

CAPES OR CLOAKS.

Made of various lengths, from half to three-quarters circle, on light materials, silicia, &c.; buttoned down the front. An excellent article for ladies' or gentlemen's wear, and for the protection of uniforms, &c. &c.

SIZES — 1, 2, 3, 4.

Black, - - -	Vulcanized,	^{EACH.} \$4 00
White, - - -	do.	5 00
Black, - - -	Solarized,	3 00
White, - - -	do.	4 00

OFFICER'S COATS.

Double-breasted, long, full skirt, with pockets, standing or rolling collar, buttoned close around the neck; made on drill, or on light fabrics. A complete article for officers of the army and navy, masters of vessels, pilots, &c.

SIZES - 1, 2, 3, 4.

EACH.

Black,-	-	-	Vulcanized,	\$6 00
Black,-	-	-	-Solarized,	3 50
White,	-	-	do.	4 50

CAPES OR CLOAKS WITH SLEEVES.

Same as the Cape or Cloak on the opposite page, with addition of sleeves.

SIZES - 1, 2, 3, 4.

EACH.

Black,-	-	-	Vulcanized,	\$5 00
White,	-	-	do.	6 00
Black,-	-	-	-Solarized,	3 50
White,	-	-	do.	4 50

SACK COATS.

Single or double breasted ; long, full skirt ; pockets ; standing or rolling collar ; made on fine muslin and silicia. A first-rate business garment for mechanics, merchants, and others.

SIZES — 1, 2, 3, 4, 5.

	EACH.
Black, - - - Vulcanized,	\$5 00
Fine Black, - - - do.	- 6 00
Short Black, - - - do.	- 4 25

Black, - - - -Solarized,	3 00
White, - - - do.	- 4 00
Short Black, - - - do.	- 2 75

FIREMAN'S CAPES.

For the use of Fire Companies ; can be neatly printed if desired.

	EACH.
Black, - - - Vulcanized,	\$3 00
White, - - - do.	- 3 50

CADET CAPES.

For Military Companies, six inches longer than Fireman's.

	EACH.
Black, - - - Vulcanized,	\$4 00
White, - - - do.	- 5 00
Black, - - - -Solarized,	2 00

PEA COATS.

Double-breasted, medium skirt, pockets, standing or rolling collar; made on drilling and heavy sheeting, expressly intended for hard service: and are well adapted for surveyors, engineers, farmers, stage drivers, hackmen, exploring parties, &c.

SIZES — 1, 2, 3, 4, 5.

	EACH.
Black, - - - - - Vulcanized,	\$5 50
Heavy Lustre, - - - do. -	4 50

PONCHOS OR SARAPAS.

This article is of Spanish or Mexican origin, lately introduced into the United States. As a light, water-proof garment for riding horseback, it is unsurpassed; and by its peculiar form, affords perfect protection from rain, while allowing a free circulation of air.

Plain and fancy-printed patterns for exportation.

	EACH.
Black, Mexican, - - Vulcanized,	\$3 75
Black, do. Printed, do. -	4 25
White, do. - - - do. -	4 50
Black, Peruvian, - - - do. -	4 25

Black, - - - - - Solarized,	3 00
White, - - - - - do. -	4 00
White, Printed, - - - do. -	3 50

PANTALOONS.

Made large and full, with a gathering cord around the waist; coated upon strong and thick fabrics; intended for hard wear, in all kinds of wet work.

SIZES — 1, 2, 3.

	EACH.
Black, - - - Vulcanized,	\$3 00
Lustre, - - - do.	- 2 63
White, - - - do.	- 3 00
Black, - - - Solarized,	1 50
Fine White, - - do.	- 2 50

OVERALLS.

Made similar to pants, with front piece, covering the chest; coated on heavy and medium fabrics; a good article for provision packers, butchers, fishermen, &c.

SIZES — 1, 2, 3.

	EACH.
Black, - - - Vulcanized,	\$3 00
Lustre, - - - do.	- 2 63
White, - - - do.	- 3 00
Black, - - - Solarized,	1 75

REEFING JACKETS.

Short and full; buttoned close around the neck, with standing or rolling collar; double-breasted, with pockets. Made on heavy drilling, &c.; a regular seaman's article.

SIZES—1, 2, 3, 4, 5.

	EACH.
Black, - - - - - Vulcanized,	\$4 00
Black, - - - - - Solarized,	2 50
White, - - - - - do.	3 25

WADING PANTS.

Made on stout drilling, with neat fitting Boots. The California Pants are the best article made for Miners. The Lumberman's Pants are double thickness to the thigh. A neat, light, and well-finished article is made for the use of Clergymen.

Sizes of Boots, 6 to 13.

	PER PAIR.
Lumberman's Pants, - - - - -	\$10 00
California Mining, - - - - -	7 00

No. 3, do. do. do. 6 × 6½ do. do. 3 50

Patent Noiseless Whiffletree and Safety Transient Bolt, see Index.

HORSE SANDALS.

Price, each - - - - - \$1 75

THIS Sandal is a light and portable substitute for a lost horseshoe, and no person who drives at all should be without it. When a proper sized Sandal is obtained it should be properly fitted, an operation easily performed, by putting the Sandal into a vice, and either pressing the heels nearer together, or opening them wider, as it may require. The Sandal is immovably and firmly attached to the foot, without

nails, by means of an endless Rubber band, in half a minute; and is put on and off as readily, in a manner perfectly easy, when pointed out, though with difficulty explained in description.

The horse's foot is to be taken up and placed between the knees, and the Sandal placed upon it. The thumbs are then to be firmly pressed down upon its heels, and with the two fore fingers of each hand within the band now lying across the Sandal. Slip the inner portion of it upon the heel of the foot. Lastly, with the thumbs again stretch the fore position of the band over the toe and hook it. Sandals are not intended, neither are they required for the hind feet. The same Sandal will answer for either of the fore feet, but different sizes will be needed for different horses.

We can send the proper size by being furnished with one of the animal's old fore shoes, or the outlines of his foot (without the shoe) taken upon paper, and sent by mail. But a **CLOSE** fit at the heels, and a band so **TIGHT** that it no more than admits of being stretched over the foot, are indispensables.

HOOF OR STUFFING BOOTS.

The best article in use for applying poultices, &c. &c. to a horse's foot, when diseased or injured. It is also valuable for cold water applications, and to prevent horses from injuring themselves in the stable.

No. 6, do. - - 8 00

Jar and Vial Covers

Per gross, - - - - - \$6 00

Dr. Mattson's Patent Elastic Syringe.

This Syringe is constructed on the principle of a pump, but has no piston, and fills itself by atmospheric pressure. It requires but one hand to work it, as the figure indicates. It may be used without an assistant,

and is admirably adapted to all the purposes of a male and female syringe. It is extremely light and portable, and may be easily carried in the pocket. The outlet valve is placed at the end of the Rubber tube, which prevents the return of offensive fluid from the rectum into the syringe.

Price, per dozen, - - - - - \$25 00

A copy of an illustrated volume of 164 pages, accompanies this Syringe, (without extra charge,) entitled "Manual of Directions for the Employment of Injections in various Diseases, with Remarks upon the Nature and Treatment of Habitual Constipation; preceded by a Treatise on the Intestinal Canal, its Structure, Functions, etc., with a Description of the Digestive Process. By M. MATTSON, M.D., Fellow of the Massachusetts Medical Society, Member of Boston Medical Association, etc."

Injection Tubes, with Wood or Ivory Mountings.

No. 1, per dozen,	- - - - -	\$6 00
No. 2, do.	- - - - -	7 50

DRUGGISTS' ARTICLES.

Lewis's Elastic Syringe.

- A—Rubber Receiver.
- B—Metallic Coupling, joined to C by a screw.
- C E—Metallic Valve Chambers.
- D—Metallic Tube through which the fluid is drawn into the instrument.
- F—Rubber Tube, to which is attached, as they may be needed, the different Pipes.
- G—Pipe for Injecting the Bowels of Adults.
- H—Small Pipe for Injecting the Bowels of Children.
- I—Vaginal Tube.

FOR SELF-ADMINISTRATION.—The Elastic Receiver A should be clasped by the right hand, the end of the metallic tube D resting in the basin containing the fluid intended for use, the left hand being employed in directing the terminal tube G. By compressing the Receiver with the hand and then loosening the grasp, it immediately fills itself with the fluid. By the next compression of the hand upon the Receiver, the fluid thus drawn into the instrument is forced through the Rubber tube, and out of the terminal pipe. By this means a large or small quantity of fluid can be used without difficulty or any alteration of the Instrument.

Price, per dozen, - - - - - \$20

French Pocket Syringe.

This Syringe holds about a pint; when empty, it can be easily folded into a small compass.

Price, per dozen, - - - - - \$12, \$15, and \$18

Lewis's Metallic Pump Syringe.

- A—Base of Instrument, through which the fluid is drawn into the Barrel.
 B—Metallic Barrel, containing the Piston or Plunger.
 C—Cap, connected to the Barrel by a Screw.
 D—Piston Rod, terminating within the Barrel by the Piston or Plunger.
 E—Metallic Chamber, containing a valve to which is connected, by a Screw, the India Rubber Tube.
 F—India Rubber Tube, to the end of which the different Pipes are attached, as they may be needed.
 G—Straight Pipe, to be connected with the India Rubber Tube, when used with an assistant.
 H—Crooked or Angular Tube, to be used without an assistant.
 I—Small Pipe, for Injecting the Bowels of Children.
 J—Female or Vaginal Tube.

DRUGGISTS' ARTICLES.**Davidson's Syphon Syringe.**

The Bulb (A) and the Tubes (BB) are made of Vulcanized Rubber, all the other parts of block tin. The box (C) contains a valve opening inward, and (D) contains a valve opening outward. To this the anal pipe (E) or the vaginal pipe (F) may be fitted. By the alternate compression and expansion of

the Bulb, any quantity may be administered without moving the instrument. The ease with which it can be managed, in any posture of the body, by an invalid, and its adaptation to those cases in which the injection requires, for its efficient action, a level or even an inclined position, recommend it to the favorable notice of the public.

Price, per dozen, - - - - - \$18 00

Veterinary Syringes.

Same pattern as the above, only on a larger scale.

Price, per dozen, - - - - - \$30 00

Patent Flexible Inkstand,

Made entirely of Vulcanized Rubber, except the cup, which is of glass. Its advantages over those in general use are its perfect convenience, a mere pressure of the body of the inkstand being all that is required to force the ink into the cup; and by one turn of the cup, the ink returns to its place. The inkstand being perfectly air-tight, the ink cannot become thick and mouldy, and there is no liability of breakage, or getting out of order.

Price, per dozen, - - - - - \$12 00

Stationers' Elastic Cord and Braid,

For Memorandum and Pocket Book Manufacturers,
from 1 to 20 cord, in Silk or Cotton.

Virgin Gum or Native Rubber.

MECHANICAL ARTICLES.

Machine Belting.

THE superiority of Rubber Belting over the best Leather Belting has been proved by a trial of ten years. Rubber Belting has a smooth and even surface, seldom requires tightening more than once, and runs straight with a perfect bearing on the pulley, by which a power of twenty per cent is gained over Leather Belting. It can be constantly run in wet places, and exposed to the weather without injury. The first cost is also much less than leather.

Lace Leather

Of the first quality, and at the lowest market prices.

INDIA RUBBER HOSE.

GREAT improvements, combining strength, firmness, and flexibility, have been made in the manufacture of Vulcanized Rubber Hose, which warrant us in asserting it to be superior to any other made. It is furnished in lengths of fifty feet or less, and of any size and strength required. The sizes indicated in the list are the inner diameters. It is warranted never to stiffen by cold, nor to be affected by heat at 300 degrees Fahrenheit. Unlike leather, it requires no oiling, and is much less in price.

The Two Ply, or Conducting Hose, is not calculated to stand much pressure.

The Three Ply Hose, used for Hydrants, &c., is made to stand a pressure of 75 lbs. to the square inch.

The Four Ply Hose, used for Locomotives and for Leading Hose for Fire Engines and other purposes, is made to withstand a pressure of 175 lbs. to the square inch.

The Five Ply Hose is for Steam Fire Engines and for conducting steam.

VULCANIZED RUBBER STEAM PACKING.

This article is now generally used by the most skillful Engineers and Machinists throughout the United States. It is prepared so that 300 degrees of Farenheit does not affect it, and owes its superiority to other substances in that it retains its great elasticity, while resisting this high degree of heat, and may be used for all purposes where packing is necessary, viz. Manhole Plates, Piston Rods, Steam Joints, Steam Chests, Cylinder Heads, Stuffing Boxes, etc.

Mixed or Fibrous Packing, in Sheets, from $1\frac{1}{8}$ to $1\frac{1}{2}$ inches thick, 40 cts per lb.

Gum or Plain Packing, for fine joints, of all thickness and greater elasticity than mixed, in sheets from $\frac{3}{8}$ to 1 inch thick, 50 do

Pure Packing, or Vulcanized Sheet Rubber, for Valves, or places where very great elasticity is needed, $\frac{1}{8}$ to 2 inches thick, 50 do

Gaskets for Manhole and Handhole Plates; Steam-chests and Cylinder Heads, Packing Rings for Stuffing Boxes, Pistons, Piston Rods, and all other Steam Joints of Fibrous Packing, .. 60 to 75 do

All the above kinds are furnished in rolls, 33 to 36 inches wide, and of any required length, or made to order of any given dimensions.

Extra Pure Vulcanized Rubber Valves, for Hot and Cold Water Pumps, Vacuum Pumps, Foot and Delivery Valves, etc. 60 do

Very small sizes do do do 75 do

Round Packing, with Duck outside, for Stuffing Boxes, Piston Rods, etc. 75 do

Pure Vulcanized Rubber Gaskets, Washers, Rings, etc., with or without Cloth Insertions, .. 60 to 75 do

Pure Vulcanized Rubber Hinge Valves, 75 do

Very small sizes, do do do \$1 00

Water Pails and Fire Buckets, - - - See Index.

VULCANIZED RUBBER SOLING,

FOR BOOTS

AND SHOES,

Is less expensive and much more durable than leather, and is entirely unaffected by heat or cold. It will effectually protect the feet from the dampness of the ground—keep them dry and warm—and enhance the comfort, as well as protect the health of the wearer. It can be easily applied, by observing the printed directions. The Rubber is furnished in sheets one yard wide, and of various lengths and thicknesses.

DIRECTIONS FOR PUTTING ON.

The sole should be perfectly dry and clean, then well rasped, so as to leave a rough surface. Apply three coats of the Cement to the Leather, allowing each to dry before the succeeding one is put on. Wet the cloth upon the Rubber with Camphene—strip it off—cut the Rubber into pieces of a proper size, and tack the edges to a board, ready to receive the Cement. Then apply two coats of Cement to the Rubber, on the side from which the cloth has been removed. When the Cement on each part is dry, and while it is yet slightly sticky, press the Leather and Rubber firmly together with a roller, and trim the sole bevelling, with a knife wet in water, leaving it quite thin at the edges.

Soling of any thickness, - - - - - 65 cents per lb..

Rubber Cement,

For Rubber Belting, Soling, and Repairing, in Tin Canisters, securely packed, one doz. in a box.

Per dozen, - - - - - \$3, \$6, and \$12 per dozen.

Japan Sponge Blacking,

For Reblacking Rubber and Patent Leather Boots and Shoes, producing a smooth lustre, not easily defaced.

Per dozen bottles, - - - - - \$4 00

Noiseless Whiffletree and Transient Bolt.

By the application of Vulcanized Rubber and malleable iron to the different parts of a carriage, the continued rattling and constant wear is obviated, and the numerous accidents and detentions occasioned by the Whiffletree Bolts and Transient Bolts getting out or breaking off, are prevented.

Kenny's Patent Noiseless Carriage Irons.

VULCANITE

OR HARD GUM.

By the combination of Sulphur with India Rubber, subjected to different and high degrees of heat, a new substance is produced, which Mr. Goodyear styles VULCANITE, or HARD GUM. This compound is now manufactured into imitations of Buffalo Horn, Buck Horn, Marble, Shell, Ivory, Whalebone, Leather, Enamel, and the hardest woods, and is destined to supersede these materials—most of which are becoming scarce—in an endless variety of applications. In appearance it perfectly imitates them, and in quality is often greatly superior—being susceptible of no corrosion—no oxydation—no decay. It is easily polished, surpassing Ebony in lustre, while the sculptured articles possess all the delicacy and finish of the most perfect work of the chisel. It excels in elegance of form and in durability all the trinkets of Glass and of Jet, rivalling Mother of Pearl and Porcelain. Leather is imitated even in color, and the imperviousness of the material peculiarly adapts it for the binding of books, albums, etc., while its impressibility renders it capable of the most delicate chasing and embossing. Unaffected by acids and resisting the action of oils, it becomes invaluable to the Chemist and Druggist, and for handles of Cutlery, Brushes, and various Toilet articles, it will soon supplant those materials which are injured by hot water. The metals themselves must give place to VULCANITE in various uses, and its non-conducting properties admirably adapt it for Insulators, Telegraph Wire, etc. As an Enamel, iron is protected from rust, glass and crockery from breaking, and wood is rendered stronger and more ornamental.

Wonderful and various as are the articles already produced from VULCANITE yet the manufacture is but in its infancy; and the new and interesting applications constantly developing convince one that it is capable of great achievements, and its work has only commenced. Few persons have any idea of the extent and variety of its transformations, nor of the important place it is destined to assume among the industrial arts.

This Catalogue is by no means complete, comprising only the articles already manufactured and offered for sale.

VULCANITE SYRINGES.

VULCANITE, from its non-conducting properties, and from its resistance to the action of oils and acids, surpasses every other substance in its peculiar fitness for Syringes.

The neatness and beauty, in addition to the perfect mechanical construction of these Syringes, make them deservedly popular.

VULCANITE ARTICLES.**Pump Syringes.**

The barrel and male and female pipes being of Vulcanite, and the tubing of Vulcanized Rubber, renders this Syringe the most perfect of anything of the kind yet manufactured. It is considered decidedly superior to other Syringes, as it has none of the uncomfortable coldness of metal.

GUTTA PERCHA.

THIS article is produced from the juice or sap of the Gutta Tree, found in all the islands of the Indian Archipelago, the Malayan Peninsula, and vicinity. The word "Gutta" means gum, and "Percha" tree, in the Malay language. There are several inferior varieties, Gutta Tuban, Gutta Girek, &c.

Gutta Percha, in its crude state, has no resemblance to India Rubber, nor are its chemical and mechanical properties the same. It is a fibrous substance, much resembling sole leather, tenacious without elasticity or much flexibility. At 120 degrees of Fahrenheit, it can be plated or moulded, by mechanical pressure, into any form, and when cold will retain the given shape, but at no temperature does it possess the peculiar elastic extensibility of India Rubber.

Oils, alkalies and saline solutions have no effect upon Gutta Percha, but strong acids dissolve and decompose it. Goodyear's vulcanizing process has been applied to it, but it is certain that it does not have the same effect upon that as it has upon India Rubber. After a time, clothing and other articles manufactured from Vulcanized Gutta Percha, become hard and brittle, oxydizing, so as to be worthless. Still it is well adapted for tubing, and all purposes not requiring it to be exposed in a dry atmosphere or to high degrees of heat and cold.

As Gutta Percha is unaffected by the most corrosive water, it forms a desirable substitute for lead pipes of aqueducts, etc. Being essentially a non-conductor, it is successfully applied to all telegraphic purposes.
